CS 325 - Fall 2024
Date Last Modified: 12/10/24

Code Files:

- 325design.sql
 - Description: SQL file with create table statements. As well as comments describing the table's purpose.
- 325populate.sql
 - Description: a SQL file that populates our tables with data.
- 325show-contents.sql
 - Description: shows all the table's contents using select statements.
- 325queries.sql
 - Description: SQL file that contains examples of queries using our prototype database.
- 325report(1,2,...,6).sql
 - Description: SQL file that creates example reports from our prototype database.
- 325triggers.sql
 - Description: SQL file that contains 2 triggers on our database.

Set-up Instructions:

- Create Database Schema
 - Use the 325design.sql script to create the database schema
 - This script will define the table structures, including columns, data types, constraints, and relationships
 - Execute this script first to set up the database structure
- Populate Initial Data

- Use the 325populate.sql script to insert initial data into the tables
 - This script will add starter records to populate the database with baseline information
 - Run this script after successfully executing the design script
- Verify Database Contents
 - Use the 325show-contents.sql script to display the contents of the database
 - This script will help you confirm that the data was correctly inserted
 - Run this script to view the current state of the database tables
- Get Database Queries
 - Use the 325queries.sql script to display various queries for the contents of the database
 - Run this script to view the results of the queries
- Get Database Reports
 - Use the 325report(1,2,...,6).sql script to display various reports for the contents of the database
 - Run each report to see the results of a particular report
- Get Database Triggers
 - Use the 325triggers.sql script to display various reports for the contents of the database
 - Run each report to see the results of a particular report
